Hypokalemia: Treatment

- Address the causes & underlying condition
- Dietary supplements : leafy green vegetables, tomatoes, citrus fruits, oranges or bananas
- Oral K replacement preferred
- IV: KCl 0.5-1 mEq/kg over 1 hr (rate of 10 mEq/hr)
- K Acetate or K Phos as alternative
- Add K sparing diuretics
- Correct hypomagnesemia

IV Treatment of Low Potassium per UofM CVC ICU Protocol Guidelines

Serum potassium concentration	Intravenous potassium dose*	Recheck serum potassium concentration
3.8 – 3.9 mEq/L	20 mEq potassium intravenously	2 hours after completing dose
3.5 – 3.7 mEq/L	40 mEq potassium intravenously	2 hours after completing dose
3.2 – 3.4 mEq/L	50 mEq potassium intravenously	2 hours after completing dose
2.9 – 3.1 mEq/L	60 mEq potassium intravenously	Immediately after completing dose
< 2.9 mEq/L	80 mEq potassium intravenously and notify MD	Immediately after completing dose

36

Table 4. Potassium Supplements

Supplement	Attributes
Controlled-release microencapsulated tablets	Disintegrate better in stomach than encapsulated microparticles; less adherent and less cohesive ³⁸
Encapsulated controlled-release microencapsulated particles	Fewer erosions than wax-matrix tablets ³⁸⁻⁴²
Potassium chloride elixir	Inexpensive, tastes bad, poor compliance; few erosions; immediate effect ^{43,44}
Potassium chloride (effervescent tablets) for solution	Convenient, but more expensive than elixir; immediate effect
Wax-matrix extended-release tablets	Easier to swallow; more gastrointestinal tract erosions compared with microencapsulated formulations ³⁸⁻⁴²

Therapy

• Consider potassium replacement in patients with hypokalemia.

• In patients with hypokalemia, potassium replacement should be given as follows:

- Oral potassium replacement is preferred.
- Intravenous potassium replacement is reserved for severe hypokalemia.

Notes

• Oral potassium replacement is preferred.

• Intravenous potassium replacement is reserved for severe hypokalemia.

Approach to hypokalemia

- Consider risk factors for arrhythmia:**
 - EKG changes (especially QT prolongation)
 - Digoxin
 - Myocardial ischemia
 - Concomitant severe hypomagnesemia
- Evaluation**
 - Check magnesium level
 - Repeat electrolytes if doubt exists about their validity (e.g. incongruous with clinical context & EKG)
- Consider magnesium repletion**
 - May be the fastest way to reduce the risk of arrhythmia (aggressive magnesium can be given safely, whereas potassium needs to be given at a controlled rate).
 - Repletion of Mg is often necessary to successfully replete the potassium.
- Consider target potassium level**
 - Most patients (including cardiac patients): >3.5 mM
 - Severe renal failure: >3 mM ?
 - DKA: >5.3 mM ?
- Enteral potassium is preferred if possible**
 - Contraindications to enteral route** = severe hypokalemia (<2.5 mM), NPO, or profound shock with questionable enteral absorption.
 - Dose & monitoring depend on renal function & estimated potassium deficit.
- Intravenous potassium**
 - Use only if **contraindication to enteral**.
 - Rate of 10 mEq/hr for routine repletion.
 - Rate of 20 mEq/hr for severe hypokalemia or DKA (either via central line or split into two simultaneous infusions of 10 mEq/hr in two peripheral lines).
 - Dose & frequency of monitoring depend on renal function & estimated deficit.
