

SIMPLIFY NETSUITE INVENTORY

CYCLE COUNTS

Inventory Count makes cycle counting in NetSuite easy. Perform regular physical inventory counts to match your inventory records. Set up next count date, and count interval, such as 30 days, 60 days, 90 days, and so on. With this feature, a backend script runs on a daily basis to check which items need to be counted.

ITEM SCANNING

Works with any barcode scanner and allows you to scan inventory in real-time. To add your item with the Inventory Count SuiteApp, simply scan your item, add serial number, select the location and bin number.

WORKSHEETS

Inventory Count comes with a worksheet containing data around item name, location, description, and bin, which can be imported into NetSuite once filled out by warehouse employees. This worksheet is then compared against data stored in Inventory Count and is used in calculating variance.

IMPORT COUNTS

Use the Import Assistant to select saved CSV files with count data already imported into NetSuite. The Import Assistant will map and import all the items in the CSV file to the Inventory Count screen.

FEATURES AND BENEFITS

- Add cycle counts easily across all items
- Full control before the adjust is made
- Track counted and uncounted items
- Get item count notifications on a scheduled date
- Count with any combination of Item, Bin and Location

- Scan multiple item types-Inventory, Assembly, Serialized and Lot Numbered items
- Make quick changes to the count record without having to perform the count all over again
